

Conditionals and Control Flow

Nested Conditional Statements

A nested conditional statement is a conditional statement nested inside of another conditional statement. The outer conditional statement is evaluated first; if the condition is `true`, then the nested conditional statement will be evaluated.

```
boolean studied = true;
boolean wellRested = true;

if (wellRested) {
    System.out.println("Best of luck today!");
    if (studied) {
        System.out.println("You are prepared for
your exam!");
    } else {
        System.out.println("Study before your
exam!");
    }
}

// Prints: Best of luck today!
// Prints: You are prepared for your exam!
```
