

Deploying Web Apps with Heroku

Deployment

With Heroku, you can quickly deploy back-end and full-stack applications to share Minimal Viable Products and Proof of Concepts.

Linking a Repo

You can link a GitHub repository to your Heroku project and have that repository's code deployed (as long as Heroku supports the language in the repository).

Manual or Automatic Deployment

You can opt to deploy your app manually or automatically based on your GitHub repository updates.

Logs

To check if your app is up and running, check the provided logs in your Heroku project's dashboard.

Offerings

There are many free features offered by Heroku and paid plans for users who need more.

Command Line Interface

For more advanced features, Heroku offers a Command Line Interface (CLI) to configure settings directly from your terminal.
